

A simple starting point for anyone new to computers — files, folders and everyday tasks explained in plain language.

1. Files and Folders

A **file** is a single item saved on your computer — a document, a photo, a song. A **folder** is like a physical folder: it holds files (and other folders) so you can keep things organized instead of scattered everywhere.

- Give files clear names — "CV_Fahim_2026.docx" is far more useful than "Document1.docx".
- Create folders by topic (e.g. "CV", "Bills", "Course Notes") instead of saving everything on the Desktop.
- Right-click on the Desktop or inside a folder, then choose New > Folder to create one.

2. Turning Your Computer On and Off Safely

- Always use Start > Power > Shut down to turn off — don't just hold the power button unless it's frozen.
- Before shutting down, save and close any open documents.
- Restart your computer occasionally — it clears temporary glitches and installs pending updates.

3. Connecting to Wi-Fi

- Click the Wi-Fi icon in the bottom-right corner of the screen (near the clock).
- Choose your network from the list and enter the password when asked.
- Once connected, tick "Connect automatically" so you don't have to repeat this every time.

4. Basic Troubleshooting

Problem	Try this first
App is frozen / not responding	Press Ctrl + Shift + Esc to open Task Manager, select the app, click End Task.
No internet connection	Check the Wi-Fi icon is connected; restart the router if needed.
Computer is running slowly	Close apps and browser tabs you're not using; restart the computer.
Can't find a saved file	Use the search bar next to the Start menu and type the file name.
Printer not working	Check it's switched on and connected; restart both the printer and computer.

This is just the starting point. Our Professional Computer Basics Course builds on exactly this foundation — Word, Excel, PowerPoint, Canva and real office workflows.
