

Computer Basics, Keyboard Typing, MS Word, MS Excel, MS PowerPoint and Canva — everything in one premium, print-ready handbook.

This handbook brings together our most popular free guides, plus bonus sections you won't find anywhere else on our site — 10 essential Excel functions, and a practical guide to presentations that don't put your audience to sleep.

Part 1 — Computer Basics

Files and Folders

A **file** is a single item saved on your computer — a document, a photo, a song. A **folder** is like a physical folder: it holds files so you can keep things organized instead of scattered everywhere.

- Give files clear names — "CV_Fahim_2026.docx" beats "Document1.docx".
- Create folders by topic instead of saving everything on the Desktop.
- Right-click, then New > Folder, to create one.

Basic Troubleshooting

Problem	Try this first
App is frozen	Ctrl + Shift + Esc to open Task Manager, End Task.
No internet	Check the Wi-Fi icon; restart the router if needed.
Running slowly	Close unused apps/tabs; restart the computer.
Can't find a file	Use the search bar next to the Start menu.

Part 2 — Keyboard Shortcuts

Shortcut	What it does
Ctrl + C / X / V	Copy / Cut / Paste
Ctrl + Z / Y	Undo / Redo
Ctrl + S	Save the current file
Ctrl + P	Print the current file
Ctrl + F	Search within the page or app
Alt + Tab	Switch between open windows
Windows + D	Show or hide the desktop
Ctrl + Shift + Esc	Open Task Manager directly

Part 3 — MS Word Shortcuts

Shortcut	What it does
Ctrl + B / I / U	Bold / Italic / Underline
Ctrl + E / L / R / J	Center / Left / Right / Justify align
Ctrl + Home / End	Jump to the start / end of the document
Ctrl + N / O / S	New / Open / Save document
Ctrl + Enter	Insert a page break
Ctrl + K	Insert a hyperlink

Part 4 — Excel Formula Cheat Sheet

Formula	What it does
=SUM(range)	Adds up a range of numbers.
=AVERAGE(range)	Finds the average of a range.
=IF(test, true, false)	Returns one value if true, another if false.
=SUMIF / =COUNTIF	Adds / counts cells that meet a condition.
=VLOOKUP(. . .)	Looks up a value in another table.
=TEXT(value, format)	Formats a number or date as text.
=TODAY()	Inserts today's date, updates automatically.
=TRIM(text)	Removes extra spaces from text.

Bonus — 10 Excel Functions Every Office Worker Should Know

Beyond the basics: **COUNTA** counts non-empty cells (numbers or text). **MAX/MIN** find the largest or smallest value. **INDEX/MATCH** is the modern, more flexible cousin of VLOOKUP — it looks up a value's position and pulls back matching data even when the lookup column isn't first. **IFERROR** hides ugly error messages with a custom one instead. **CONCATENATE** (or the & symbol) joins text from separate cells — handy for combining a first and last name.

Part 5 — Bonus: Presentations People Actually Watch

Most PowerPoint decks fail for the same reason: too much text, read word-for-word by the presenter. Here's how to avoid that.

- One idea per slide. If you need a second idea, make a second slide.
- Six words is a headline, not a paragraph — put the detail in your spoken notes, not the slide.
- Use one consistent font and 2-3 colors across the whole deck, not one per slide.
- A relevant image says more, faster, than a bullet list — use Canva to source and place them cleanly.
- End every deck with a clear next step: what should the audience do after this?

This handbook is a companion to our Professional Computer Basics Course, where every one of these topics is taught hands-on, with real exercises and a certificate on completion.
